FORMAT

Copy → paste → run

READ TIME

5 minutes

HOW TO USE THIS

Open Claude Design (bottom-left in the desktop app, or claude.ai). Work top to bottom — read the "why," then copy the prompt and paste it in. Swap anything in [brackets] for your own words first.

Chapter 1 • Make Your First Thing

Three prompts to get something on the canvas in five minutes. Note: Claude Design now pulls from your normal Claude plan (Pro/Max), the same pool as Code and Cowork — not a separate, small limit.

STEP 1

Make your first web app prototype

Describe an app in plain English and Claude Design draws the screens — the fastest way to see what the platform can do.

PROMPT

Create a web app prototype for [what your app does]. Build a home dashboard, a screen to add a new entry, and a simple history/log view. Make it clean and modern with one accent color for the main actions. Show me the screens when done and tell me what I can edit or send to Claude Code next.

STEP 2

Make a slideshow

A full slide deck from one prompt — great for a quick pitch or a lesson, every slide on one clean layout.

PROMPT

Create a 10-slide presentation about [your topic]. Each slide should have a short headline and one clear idea — open with a title slide and a one-line promise, walk through the main points, end on a simple call to action. Keep it clean and consistent.

STEP 3

Make a mobile app prototype

The same idea, designed for a phone screen — shows exactly how the idea would feel before you build anything.

PROMPT

Create a mobile app prototype for [what your app does]. Design it for a phone screen with a bottom navigation bar, a main screen, and one or two key flows a user would actually tap through. Keep it modern and minimal.

Chapter 2 · Build Your Design System

The most important part. Set your brand once and everything you make afterward stays on-brand automatically.

STEP 4

Build your design system from scratch

In Claude Design, click Design system → Create from scratch. Upload your logo/colors/fonts if you have them, then paste this:

PROMPT

I want to build my design system from scratch. Here's my brand: [name and what you do]. Colors: [your palette, or "suggest one"]. Fonts: [your pairing, or "suggest a clean one"]. Vibe in three words: [e.g. clean, premium, friendly]. Turn this into a full system — palette, type styles, buttons, cards, spacing — then show me a sample screen using it. When I approve it, save it so every new design uses it automatically.

STEP 5

Already have a style in Claude Code? Import it

If your design system already lives in Claude Code, click Design system → Use Claude Code — it hands you a command to run there.

COMMAND

design sync

Chapter 3 • Make It Yours

Edit without burning tokens, then make a branded animation. Click Edit top-right to change text/color directly on the canvas — use chat only for big changes.

STEP 6

Make a branded animation

A short animated video that matches your design system — no video editor needed. Pick the Animation template and select your design system first.

PROMPT

Create a short product-launch style animated video that explains [your topic]. Use my design system so it matches my brand. Keep it simple — a few clean scenes, one idea per scene, smooth transitions, short on-screen text.

Chapter 4 · Turn a Design Into a Real App

Click Share → Send to → Claude Code. It hands you a prompt that lands your design there, ready to build.

STEP 7

Add a database with Supabase

First connect Supabase once (Customize → Connectors → Supabase). Then paste this into Claude Code.

PROMPT

Turn this design into a real, working app. Use the Supabase connector to build the backend — create the tables it needs, wire the screens to add/view/save real data, and make sure entries stay saved on refresh. Explain in plain English what you set up and how to test it.

STEP 8

Connect any other app with Zapier

If an app you want isn't in the connector list, Zapier's MCP links Claude to thousands of apps. Create a new MCP server in Zapier with Cowork as the client, connect it once, then test it.

TRY SAYING

Using the Zapier connector, add these contacts from my CSV into [your tool].

Make a design, make it yours, then ship it as a real app.
