

The breakdown of Garry Tan's open-source Claude Code setup

GStack.

Y Combinator's CEO open-sourced the 23 Claude Code skills he uses to ship like a full engineering team. Here's the map to every one of them.

What Is GStack

Most people use Claude Code like one assistant — ask, answer, done. Garry Tan, CEO of Y Combinator, open-sourced his full setup instead: 23 Claude Code skills that turn Claude into a coordinated engineering team — a CEO, a designer, an engineer, a QA lead, a security officer, and a release manager, all running as slash commands.

It's free, MIT-licensed, at github.com/garrytan/gstack.

THE CORE IDEA

A solo builder with the right roles moves faster than a full team. Each skill catches what the others miss — you ship more in a day than most teams ship in a sprint.

The 6 Roles

1

CEO

Challenges your scope, kills bad ideas before you build them.

2

Designer

Explores directions, turns the winner into production-ready HTML.

3

Engineer

Writes the code, runs the planning pipeline.

4

QA Lead

Spins up a real browser, clicks every button, catches what the engineer missed.

5

Security Officer

Runs OWASP + STRIDE audits before you ship.

6

Release Manager

Opens the PR, ships to production, watches the deploy.

The Full Skill List

<code>/office-hours</code>	Pressure-tests your idea before you build
<code>/plan-ceo-review</code>	Cuts scope to the smallest version that works
<code>/design-consultation</code>	Senior-designer-style feedback on your work
<code>/design-shotgun</code>	Explores many visual directions in parallel
<code>/design-html</code>	Turns the chosen direction into real, shippable HTML
<code>/review</code>	Staff-engineer-style code quality audit
<code>/investigate</code>	Finds the root cause, not just the symptom
<code>/autoplan</code>	Hands-off planning — give it the goal, it runs it
<code>/qa</code>	Real Chromium browser-based testing
<code>/ship</code>	Opens the PR, writes the description, deploys
<code>/cso</code>	OWASP Top 10 + STRIDE security audit
<code>/browse</code>	Drives a real browser — click, scroll, fill, screenshot
<code>/canary</code>	Watches for regressions right after deploy
<code>/benchmark</code>	Flags slow pages and heavy bundles

How to Install It

1 Get the basics

Claude Code, Git, and Bun v1.0+ (grab Bun at bun.sh).

2 Clone the repo

`git clone https://github.com/garrytan/gstack`

3 Drop the skills into Claude Code

Move them into your `.claude/skills` folder — that's where Claude looks for slash commands.

4 Start with `/office-hours`

Open Claude Code on whatever you're building and run it — you'll feel the difference in the first 30 seconds.

A DAY IN THE LIFE

Morning: `/office-hours`. Late morning: `/design-shotgun`, then `/design-html`. Afternoon: `/autoplan`. Evening: `/qa`, `/cso`, `/ship`. One person, four phases, shipped before dinner.

Do This Today

01 Install Bun if you don't already have it.

02 Clone gstack into your projects folder and drop the skills into `.claude/skills`.

03 Run `/office-hours` on whatever you're building right now.
