

A workflow shift straight from Anthropic's own Claude Code team

HTML > Markdown.

One line added to your prompt changes what Claude gives you back. Here's the thesis, the receipts, and five paste-ready prompts to steal.

The Thesis

Thariq Shihpar, a member of the Claude Code team at Anthropic, published a widely-shared breakdown in 2026 making a simple case: stop asking Claude for Markdown by default. Ask for HTML instead.

He tested 20 real Claude Code outputs side by side, once as Markdown, once as HTML. HTML won the large majority — and the 20 or so it "lost" were outputs no human ever actually looked at.

WHY NOW

Markdown became the default years ago because it was cheap on tokens, back when context windows were tiny. That constraint is gone — today's windows are enormous, and token cost is a rounding error. With the one thing that made Markdown win taken off the table, HTML wins on everything else: visuals, interactivity, density, shareability.

Where HTML Wins

1 Plans and exploration

Side-by-side mockups, timelines, and risk tables you can actually scan.

2 Code reviews

Inline diffs, color-coded severity, margin annotations.

3 Design systems

Clickable swatches, component variants, live animation sandboxes.

4 Diagrams

Embedded, clickable flowcharts instead of described-in-words.

5 Reports and dashboards

Status reports with real charts, drag-and-drop boards.

6 Two-way interaction

Sliders, knobs, live-tunable values — Markdown is read-only, HTML talks back.

7 Shareability

One self-contained file, opens in any browser, no conversion needed.

When Markdown Still Wins

Be fair to it — Markdown still beats HTML anywhere no human ever sees the output: Claude's own scratchpad inside an agent loop, quick throwaway chat replies, or anything where formatting genuinely doesn't matter.

The Upgrade: One Line

You don't need a new tool. Add one sentence to the end of any prompt:

THE UPGRADE

Output as a single self-contained HTML file.

5 Paste-Ready Prompts

PROJECT PLAN DASHBOARD

Plan the launch of [PROJECT]. Output as a single self-contained HTML file with a phase timeline at the top, an owner table in the middle, and a risk matrix at the bottom.

CODE REVIEW

Review the attached pull request. Output as a single self-contained HTML file with the diff rendered inline, severity tags color coded, and a one-paragraph summary at the top.

RESEARCH DASHBOARD

Research [TOPIC] across at least 5 sources. Output as a single self-contained HTML file with a TLDR card, a source comparison table, and collapsible sections for each source's key points.

INTERACTIVE CHEAT SHEET

Build a one-page cheat sheet on [TOPIC]. Output as a single self-contained HTML file with tabs by subtopic, copyable code snippets, and a search box that filters as I type.

MEETING SUMMARY

Summarize the meeting transcript I'm about to paste. Output as a single self-contained HTML file with a headline summary, an action item table grouped by owner, key decisions, and open questions.

Do This Today

- 01 Pick the next thing you'd normally ask Claude for — a plan, review, or summary.
 - 02 Add the one-line upgrade to the end of the prompt.
 - 03 Open the file and compare it to what Markdown would have given you.
-
