

The AI Marketing Playbook

A start-to-finish system for running content, outreach, and reporting through Claude — set up once, then let it run.

How to use this. Open Claude and point it at a folder on your computer — that folder becomes your workspace. Work top to bottom: read the "why this matters" note on each card, then copy the prompt and paste it into Claude. A few steps use connectors you switch on once in Claude's settings (Gmail, a design/video tool, a spreadsheet or database, and an SEO tool) — none of it requires code.

Teach Claude Your Brand

Set up a workspace that knows who you are, then build reusable skills that write like you.

STEP 1

Build your marketing workspace

What this does: Claude creates a folder structure and a short brand file that holds who you are, what you sell, and how you sound. **Why it matters:** once Claude knows your business, everything it writes comes out sounding like you instead of generic AI copy.

Set up a clean workspace for running my marketing in this folder.

First ask me three quick questions, all at once:

1. What do I sell, and who do I sell it to?
2. What do I want to run here – content, social, email, lead gen, or all of it?
3. Anything about my voice I should know up front (tone, words I use, words I avoid)?

Then build:

- A root BRAND.md with my identity, offer, audience, and voice. Keep it short and specific
- every line should change how you write for me.
- A root NOTES.md to track facts over time (offers, results, decisions).
- Folders: content/, social/, email/, leads/, assets/.

Keep BRAND.md tight. Don't invent folders I didn't ask for.

When done, show me the folder tree and a one-line summary of my BRAND.md.

CONCEPT

What a "skill" actually is

A skill is a set of instructions you save once, under a name and a trigger phrase. Say the trigger, and Claude follows those steps every time — which is why everything you build stays consistent, and why one skill can call other skills.

STEP 2

Build your voice skills from real examples

What this does: in one pass, Claude learns your actual writing — your sent emails, a blog post, a newsletter, a LinkedIn post you give it — and turns each into a reusable skill. **Why it matters:** because each skill learns from something you actually wrote, the output sounds like you from the very first draft.

Set up my content skills, each one learned from a real example of mine:

1. email-voice – read my last 20-30 SENT emails (skip one-word replies) and learn my tone, greetings, sign-offs, and words I use/avoid. Save as a skill that drafts emails in that style. Only READ my email, never send anything.
2. blog-post – I'll paste a real blog post. Learn its structure and voice, save a skill that writes full posts (hook, clear headings, a call to action) into content/.
3. newsletter – I'll paste a real newsletter. Save a skill that writes an inbox-ready email (subject + two alternates, tight body, one CTA) into email/.
4. linkedin-post – I'll paste a real post. Save a skill that writes posts (strong first line, short paragraphs, soft CTA) into social/.

Ask for my examples up front, confirm before reading email. When done, list the skills and each trigger phrase.

STEP 3

Build a conductor that runs them all

What this does: one skill that takes a single video or article and runs your blog, newsletter, and LinkedIn skills on it at once. **Why it matters:** this is the actual time saver — one source becomes a week of content, and improving any one skill improves this too.

Build a skill called "repurpose" that runs my blog-post, newsletter, and linkedin-post skills on one piece of content at once.

When triggered:

1. Ask for the source (link, transcript, or file).
2. Pull out the main ideas.
3. Run each of my existing skills on it, in my brand voice.
4. Save each output to its folder (content/, email/, social/).
5. Show a summary of what it made and where.

Don't rewrite the writing logic – call the skills I already built. Trigger on "repurpose this" or "turn this into content".

Generate Visuals Without a Design Team

Make marketing images and video right inside Claude.

SKILL

Topic to infographic

What this does: turns a topic or a handful of stats into one clean, shareable infographic. **Why it matters:** infographics get saved and shared, and this makes a polished one in a minute with no design tool.

Turn this topic into a clean, shareable infographic: [your topic or stats]

Try it on: how your product category works, a before/after comparison, a "5 mistakes" list.

SKILL

Product link to listing graphic

What this does: turns a product link or photo into a listing image with labeled feature callouts. **Why it matters:** better listing images sell more, without hiring a designer.

Turn this product into a clean listing graphic with feature callouts: [product URL or photo]

SKILL

Product photo to video ad

What this does: turns a single product photo into a short UGC-style video ad. **Why it matters:** short-form video moves product, and this needs no camera, actor, or editor.

Turn this product photo into a short UGC-style video ad: [photo]

Find and Reach New Customers

Find real people to sell to, and get outreach drafted, without leaving Claude.

STEP 1

Find and qualify leads

What this does: describe your ideal customer, and Claude builds a list of real companies and contacts. **Why it matters:** this is the part most people pay tools or VAs for.

Help me build a lead list. My ideal customer is: [describe them – industry, size, role, pain point].

Find real companies and contacts that match, and pull together what you can find on each: name, role, company, and a public contact point.

STEP 2

Draft personalized outreach as Gmail drafts

What this does: writes a personal first email to each lead and drops them in Gmail as drafts — nothing sends automatically. **Why it matters:** real, personalized outreach ready in minutes, with you still in control of send.

Take the lead list we just built and write a personalized first-touch email for each one, in my brand voice. Save each as a Gmail draft – don't send anything.

Track What Is Actually Working

Give your setup a real database, so your data compounds instead of resetting every week.

CONCEPT

Why a database, not a spreadsheet

What this does: a spreadsheet is fine for a one-off; the moment your numbers change daily, you want somewhere they can stack up and be compared. **Why it matters:** the dashboard is the face, the database is the memory — and Claude builds and runs both. No code required.

STEP 1

Build your own tracker

What this does: Claude interviews you about what to track, then sets up the storage, the data pull, and a simple dashboard. **Why it matters:** your business isn't generic, so the tracker shouldn't be either.

I want to build a tracker for my business, backed by a real database, and I want you to set it up by interviewing me first.

Ask what I want to track (content performance, leads, subscribers, sales – whatever matters to me), then set up the storage, a way to pull the data in, and a simple dashboard to view it.

STEP 2

Not just for one channel

The same setup — a table plus a dashboard — works for anything you track over time: leads and who you've contacted (a simple CRM), subscribers, or every post you publish and how it performed. Once Claude can store and query your data, it becomes the memory behind your whole marketing operation.

Get Found — By People and by AI

A beautiful page nobody finds is wasted. This is how people actually discover you.

STEP 1

Optimize for search and AI search

What this does: use an SEO tool's connector to find the right keywords and tune your page so it ranks — including in AI-generated answers. **Why it matters:** AI search is the fastest-growing discovery channel, and most sites aren't optimized for it yet.

Using [your SEO tool]'s connector, help me find the keywords my ideal customer actually searches, and optimize this page to rank for them — including in AI search results.

BONUS · EXTRA PLAYS

Bonus Use Cases

Once the core system is running, these are worth adding. Same idea as everything above — copy the prompt, make it yours.

BONUS

Build a lead magnet

What this does: a genuinely useful guide you give away for an email address. **Why it matters:** a good lead magnet turns readers into a list you can sell to later.

Create a lead magnet guide I can give away to capture emails, in my brand voice, on this topic: [topic].

BONUS

Topic to Instagram carousel

What this does: a swipeable carousel — cover plus content slides — from one topic. **Why it matters:** carousels are some of the highest-reach content on social.

Turn this topic into an Instagram carousel in my brand voice: [topic].

BONUS

Schedule a week of posts

What this does: plans a week of posts from what you've made and schedules them across your accounts. **Why it matters:** making content is the easy part — posting on time is what people quit on.

Turn the content I just made into a week of scheduled social posts, using [your scheduling tool]'s connector.

BONUS

Build a competitor tracker

What this does: a live dashboard that pulls competitors' latest content whenever you open it. **Why it matters:** you never start from a blank page.

Build me a dashboard that pulls the latest content from these competitors whenever I open it: [list competitors].

BONUS

Keep an idea logger

What this does: a simple place to capture content ideas the moment they hit, organized by platform and status. **Why it matters:** ideas you forget are worth nothing.

Build me a simple tracker to capture and organize my content ideas by platform and status.

BONUS

Get a daily ideas report

What this does: a scheduled task that emails you a short report each morning with what to react to and fresh ideas. **Why it matters:** staying relevant takes zero manual effort.

Set up a scheduled task that emails me a short daily report each morning: what's trending in my space, and 2-3 fresh content ideas.

BONUS

Ask your data anything

What this does: the real payoff of a database — ask Claude questions in plain English and get answers pulled from your actual numbers. **Why it matters:** your tracker stops being a wall of stats and starts telling you what to do next.

Using my tracker data, what's actually working right now, and what should I make more of?
